What is "Napure Mirror"? [Japanese Patent No.3732490]
The mirror reflecting the real color of your skin as seen by others
The most suitable mirror for matching the colors of your skin and a foundation and for partial makeup

Glass of high clarity + **Reflective metal layer by vacuum deposition** =

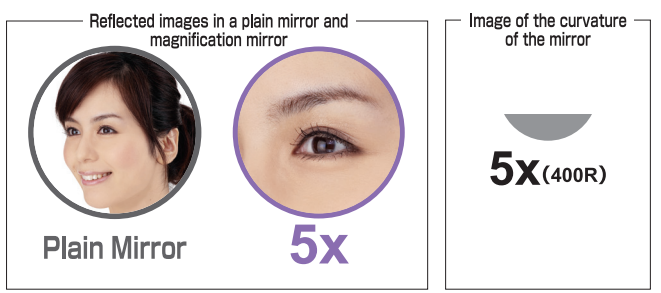

Glass of high clarity
The glass used for the conventional mirrors contains considerable amount of iron to absorb blue light of the incident light and make white color look dull. We have developed "Napure Mirror" made of clear glass with minimum iron content. "Napure Mirror" rarely changes the reflected colors to show natural and pure colors without influence by the glass. Thus "Napure Mirror" is the most suitable for matching the foundation to the colors of your skin and partial makeup.

Usage and precaution

- At first, move your face close to the magnification mirror and then move away from the mirror to find the focal point you can see clearly reflected image.
- A mirror of greater curvature has shorter focal length, in other words, you can see a clear image nearer to the mirror surface.
- A high-magnification mirror gives vague image outside the focal point.
- Do not look at the magnified image too long. It may cause eyestrain or make you feel sick.
- *Images are magnified in concave mirrors and enlarged more with the increase of their curvature. The magnification of our mirrors is roughly indicated by the radius of curvature (abbreviated as "R") of the mirrors. A magnification mirror having smaller radius of curvature (R) has greater curvature, in other words, reflects a larger image.
- *The magnification mirrors may focus the sun's rays to burn up a combustible material and cause fire. So do not use or store the magnification mirrors under direct sunlight.
